- There is a big cast, but we care about all of the new 6. _____.

2 Read the text and write *T* (True) or *F* (False).

(____ /5 pts)

Human beings have invented some incredible technology, but can you believe that some of our biggest breakthroughs have been complete accidents? For most of human history, simple infections from cuts or influenza could easily kill people. So what changed?

A Scottish medical scientist named Alexander Fleming kept bacterial diseases for study in his hospital laboratory. In 1928, he went on holiday. When he came back, there was mold growing in one of the bacteria cultures. Fleming noticed that, amazingly, there was an area around the

mold where the bacteria did not grow. After some more tests, he concluded that something in the mold was killing the bacteria. He called it penicillin.

It took many more years, and contributions from a group of other scientists, but in 1942, the first patient was treated with medical penicillin. Now, a lot of bacterial infections that killed people in the past are minor problems, thanks to penicillin and other antibiotics.

- This text is about the discovery of penicillin. T
- Alexander Fleming worked hard to discover a good antibiotic.
- Fleming made his discovery in 1929.
- Coming back from holiday, he noticed a mold killing one of his bacteria cultures.
- Three years after penicillin's discovery, scientists used it to treat the first patient.
- People still use penicillin today to treat bacterial diseases.

Speaking and Writing

1 What do you need to be happy? Discuss with a partner.

(_____/10 pts)

MONEY

family

friends
